

GoalBridge

Goal-based financial planning interface • Project documentation & UI walkthrough

Prepared by
Terence Hiten Keniya

Project focus
Goal planning • inflation-aware projections • monthly
savings plans

Submission
5-page professional report

1. Project Overview

GoalBridge is presented in the supplied material as a goal-based investment planning studio that turns a future life goal into an understandable monthly saving target. The opening interface explicitly communicates INR planning, monthly compounding, device-only plan storage, and a no-account/no-product-recommendation approach. The user journey is organized into clear stages: define the goal, review the plan, inspect the calculation, check affordability, and stress-test the return assumption.

The design emphasizes explainable planning. Instead of exposing only a final monthly number, the interface surfaces the future goal cost, future value of existing savings, funding gap, total contribution, projected growth and monthly rate used. This gives a reviewer a direct visual path from input assumptions to the resulting plan.

What the interface enables

- Create a named goal and enter the target cost in today's money.
- Set the time horizon, inflation assumption, expected return and existing savings.
- Review a monthly contribution and starting-progress indicator.
- Inspect the calculation breakdown and download the plan as CSV where shown.
- Optionally compare the plan with monthly income/commitments and test multiple return scenarios.

Figure 1. Supplied GoalBridge overview showing the goal-definition panel beside the monthly-plan result.

GOAL INPUT	MONTHLY PLAN	PLAN BREAKDOWN	STRESS TEST
Define the target and assumptions	Translate the target into a monthly amount	Explain the calculation components	Compare three return assumptions

Source basis: supplied PDF/PPT gallery and the live-site/repository links provided by the author. Descriptions are limited to functionality visible in those materials.

2. Goal Definition & Input Model

The first stage, labelled “01 / YOUR GOAL”, establishes the planning scenario. The supplied screen collects a personal goal label, the goal’s cost in today’s money, the time until the goal is needed, expected inflation, expected investment return and savings already assigned to the goal. The form also displays contextual helper text and validation messages, making the assumptions readable at the point where they are entered.

Observed input fields

Goal label — a personal description such as “Emergency”.

Cost in today’s money (₹) — the current-value starting point.

Years until needed — the planning horizon; the supplied UI states a 3-month to 60-year range.

Expected inflation — an annual assumption for how the goal cost may rise.

Expected investment return — an annual planning assumption explicitly described as not a promise.

Already set aside — savings specifically allocated to the selected goal.

Input and interaction design

The interface keeps the assumption labels, units and short explanations adjacent to the controls. This reduces ambiguity between current-value inputs and future-value outputs.

A Reset action is visible, supporting quick scenario changes. The workflow then moves toward a Review plan action rather than forcing the user to interpret calculations inside the input form.

The optional finance-review area adds monthly take-home income and monthly commitments. In the supplied material this is presented as an affordability view, explicitly distinguished from personalised financial advice.

Across the screenshots, the visual hierarchy remains consistent: section numbers, descriptive headings, large input controls, helper text and rounded cards.

Category	Value	Notes
Future goal cost	₹4,08,147	inflation-adjusted
Future value of savings	₹44,187	at assumed return
Funding gap	₹3,63,960	to be funded
Total you contribute	₹5,25,977	across the period
Projected growth	₹49,170	estimated, not guaranteed
Monthly rate used	0.49%	effective monthly rate

Category	Value
Available after commitments	₹35,000
Plan uses of available cash	19%
Buffer after this plan	₹28,250

Figure 2. Supplied desktop screenshot showing goal assumptions, finance-review inputs, plan breakdown and affordability information.

The input model is therefore both parameter-driven and review-oriented: the user can change a small set of understandable assumptions and then inspect the consequences in the same page flow. The use of INR as the common display unit keeps the scenario internally consistent from input through output.

For project evaluation, the important observable point is that the interface does not treat the monthly amount as an isolated result. The surrounding labels make the calculation context visible before the user proceeds to compare or retain the plan.

3. Calculation Output & Plan Breakdown

Once the scenario is entered, GoalBridge presents a prominent monthly-plan amount together with the period used to reach the inflation-adjusted goal. A starting-progress bar visually relates current savings to the plan, while the breakdown below exposes the intermediate financial quantities. The supplied material also shows a Download plan CSV control, giving the user a portable representation of the plan.

Future goal cost	Inflation-adjusted target value at the planned future date.
Future value of savings	Value attributed to existing savings under the assumed return.
Funding gap	Amount still needing to be funded after accounting for existing savings value.
Total you contribute	Cumulative contributions across the planning period.
Projected growth	Estimated growth under the selected return assumption; the UI notes that it is not guaranteed.
Monthly rate used	Effective monthly rate used in the displayed plan.

Figure 3. Supplied gallery screenshot illustrating the calculation breakdown and affordability context.

How the output reads

The headline monthly contribution is the user-facing action number, but the breakdown supplies the audit trail. A reviewer can follow the relationship between the inflation-adjusted future target, the value of existing savings, the remaining funding gap and the total planned contributions. This structure is useful for a project submission because it demonstrates that the UI communicates both the result and the reasoning structure behind the result.

The supplied gallery also contains different demonstration scenarios, including an Emergency goal and an Education Fund example. The changing values show that the interface responds to different assumptions rather than representing one hard-coded result. These examples should be treated as interface demonstrations, not as financial recommendations.

4. Affordability, Scenario Testing & User Flow

The supplied desktop view extends the core calculation with two supporting checks. The first is an affordability view based on monthly take-home income and commitments. The second is a stress-test section that compares conservative, base-case and optimistic return assumptions. Together, these features encourage the user to inspect whether the proposed contribution fits the stated monthly surplus and how sensitive the plan is to the chosen return assumption.

Step	Stage	Purpose visible in the supplied UI
01	DEFINE THE GOAL	Enter goal, present cost, horizon, inflation, expected return and existing savings.
02	REVIEW THE PLAN	Inspect monthly contribution, starting progress and the calculation breakdown.
03	CHECK AFFORDABILITY	Optionally compare the contribution with take-home income and monthly commitments.
04	STRESS-TEST	Compare conservative, base-case and optimistic return assumptions.
05	RETAIN / EXPORT	Keep comparable plans on the device and download the plan as CSV where shown.

Figure 4. Supplied screenshot showing affordability, saved-plan workspace and three-scenario stress testing.

AFFORDABILITY VIEW

The supplied UI reports available cash after commitments, plan usage as a percentage of available cash, and the remaining buffer. It explicitly describes this as an affordability view rather than personalised advice.

STRESS-TEST VIEW

The supplied UI places conservative, base-case and optimistic return assumptions side by side and states that this is a scenario tool rather than a forecast.

From a UX perspective, this sequence creates a coherent progression from target definition → calculation → affordability → sensitivity. The interface therefore communicates not only “how much per month?” but also “what assumptions produced that number?” and “how does the plan fit the scenario?”

5. Project Summary & Submission References

GoalBridge's supplied interface demonstrates a focused planning workflow in which a long-term financial goal is translated into a monthly saving plan while keeping the major assumptions visible. The visual system uses deep teal result cards, pale mint backgrounds, rounded panels, prominent serif-style headings in the supplied UI, compact helper text and strong section numbering. The result is a presentation-oriented interface that separates input, output and scenario review without overwhelming the user with a single dense calculation screen.

Project evaluation checklist

	Evidence visible in supplied material	Submission relevance
Goal modelling	Goal label, current cost, horizon, inflation, return and existing savings.	Clear parameterised planning workflow.
Explainability	Future cost, savings value, funding gap, contributions, growth and monthly rate are exposed.	Result is supported by an interpretable breakdown.
Affordability	Income and commitments can be entered for an optional cash-flow check.	Adds context around the monthly contribution.
Scenario testing	Conservative/base/optimistic return assumptions are shown together.	Demonstrates sensitivity analysis.
Persistence / export	Device-only saved plans and CSV download are visible in the supplied UI.	Provides a practical retention/export path.
Responsible framing	Return is described as an assumption, and the affordability view is distinguished from personalised advice.	Makes the interface framing explicit.

Submission statement

This document is intentionally limited to five pages and uses the supplied screenshots as visual evidence. Screenshot areas are kept compact so the report can remain text-dense and reviewer-friendly. Functional descriptions are based on what is directly visible in the supplied PDF/PPT gallery; unseen implementation details, frameworks or backend behaviour have not been assumed.
